

Panel Fabrication Services

PCT's panel fabrication team is experienced in providing our customers with solutions to their electrical control panel assembly needs. We have successfully provided hundreds of industrial control panels in our 20-year history. We are prepared to work from your design or to enhance your sketch with our in-house design and engineering capabilities.

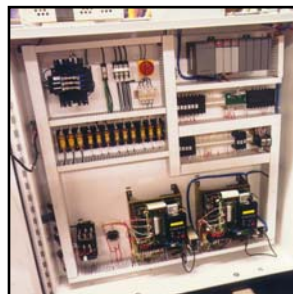

PCT can provide:

- Purchasing of necessary components
- Layout of the subpanel, operator panel or control console
- Mounting and installation of the components
- Wiring between components
- Printing and applying labels to terminal blocks, components, and both ends of all wires to aid in maintenance and troubleshooting
- Checkout and testing of the control panel
- Update the documentation set to show the panel "as-built"
- Delivery of the completed control panel

Each control panel must pass a 17-step quality checklist prior to shipment. PCT's shop is fully equipped to power-up and operate control systems if required. PCT can also provide panels that meet the stringent U.L. and CE requirements including the complete documentation set.

As part of Team PCT, our panel fabrication group also has access to a full range of engineering, design and mechanical fabrication resources.
